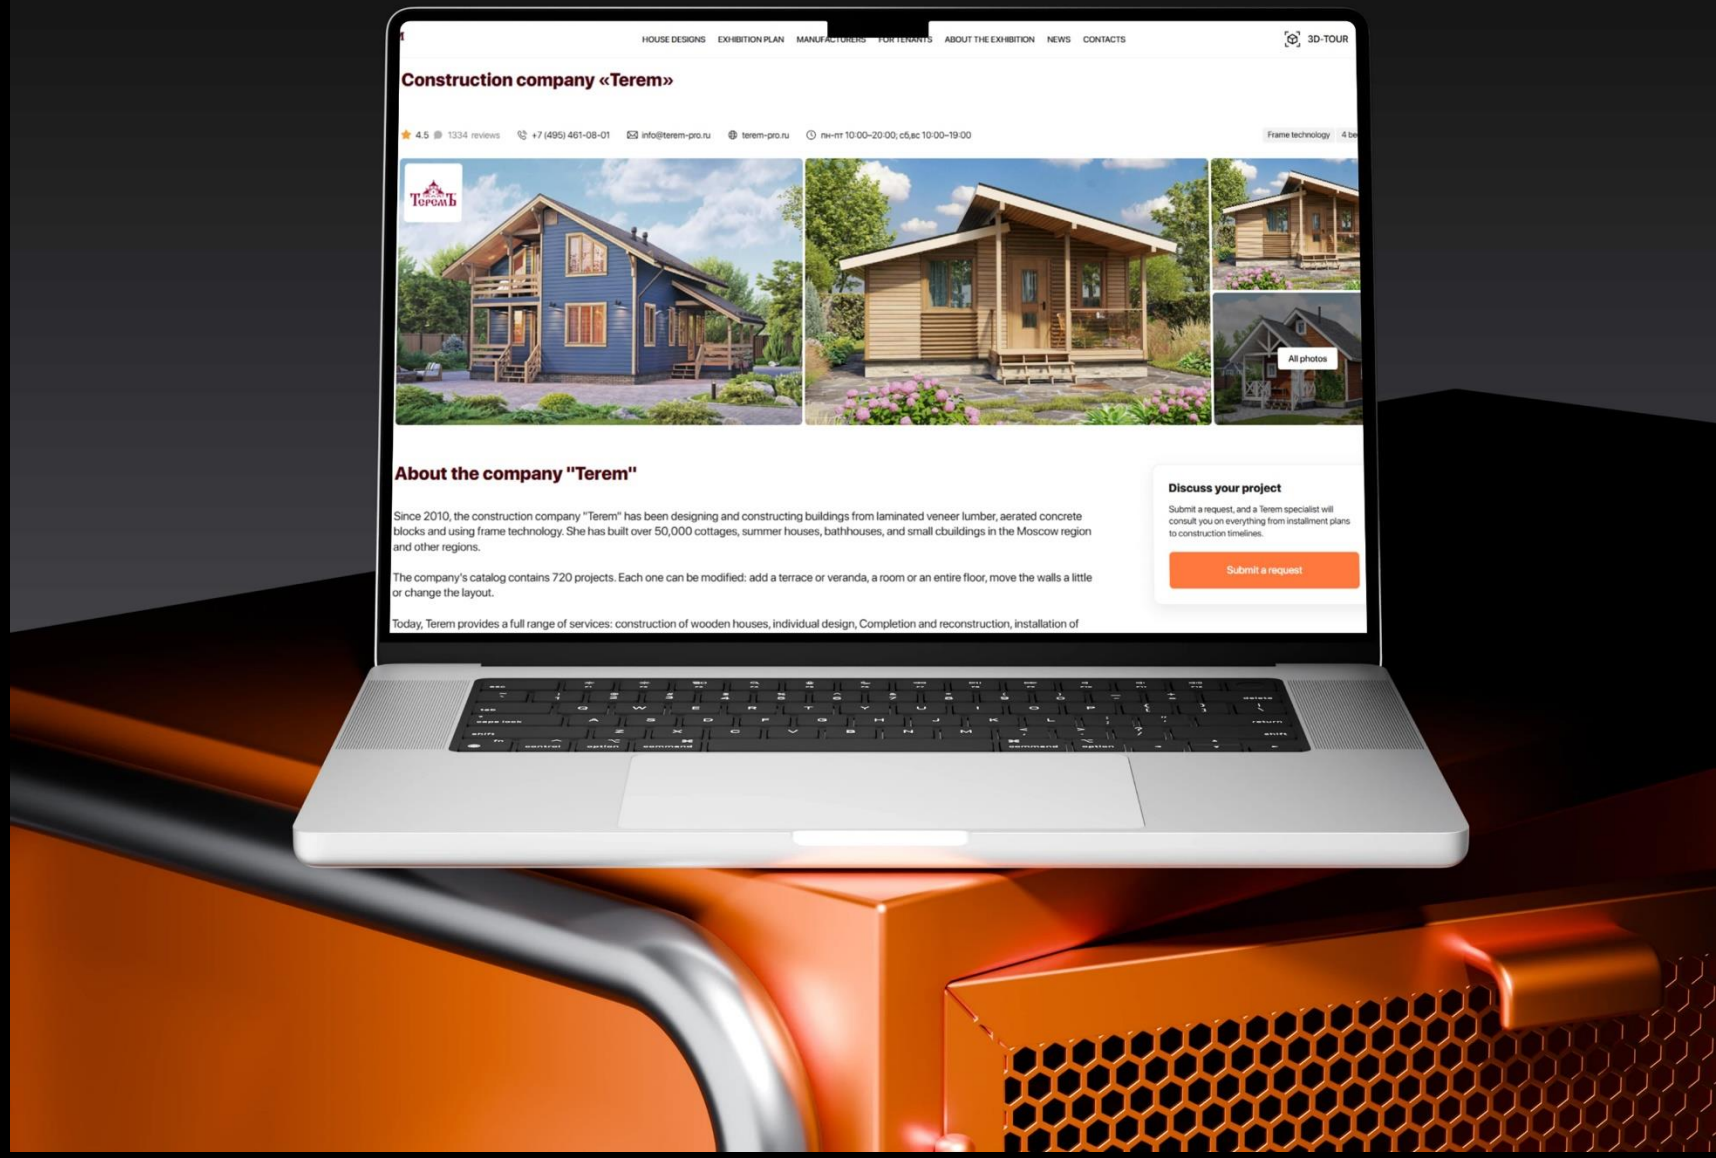
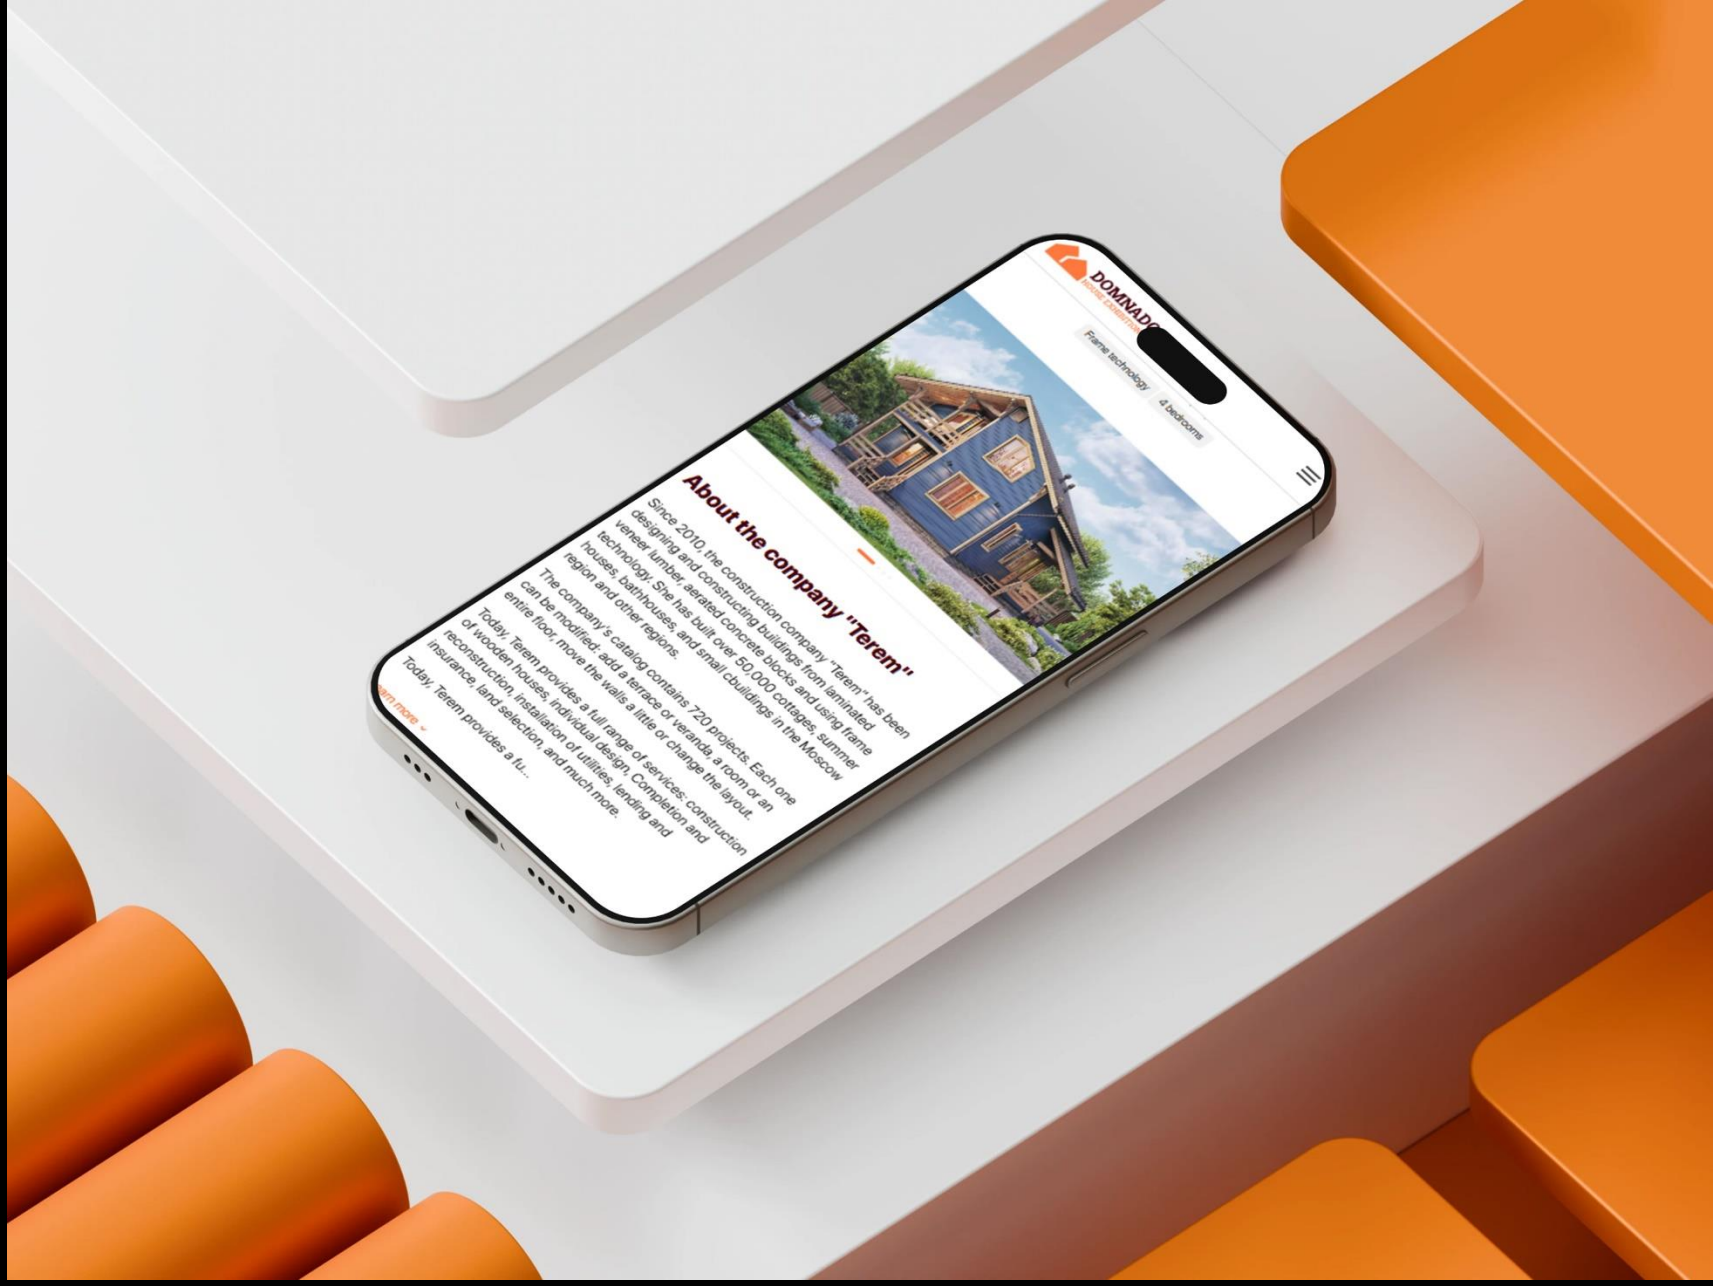
Mobile optimization: the catalog becomes a swipeable carousel. Each project card slides into view, allowing users to quickly browse through dozens of homes with a simple finger gesture — no endless scrolling.

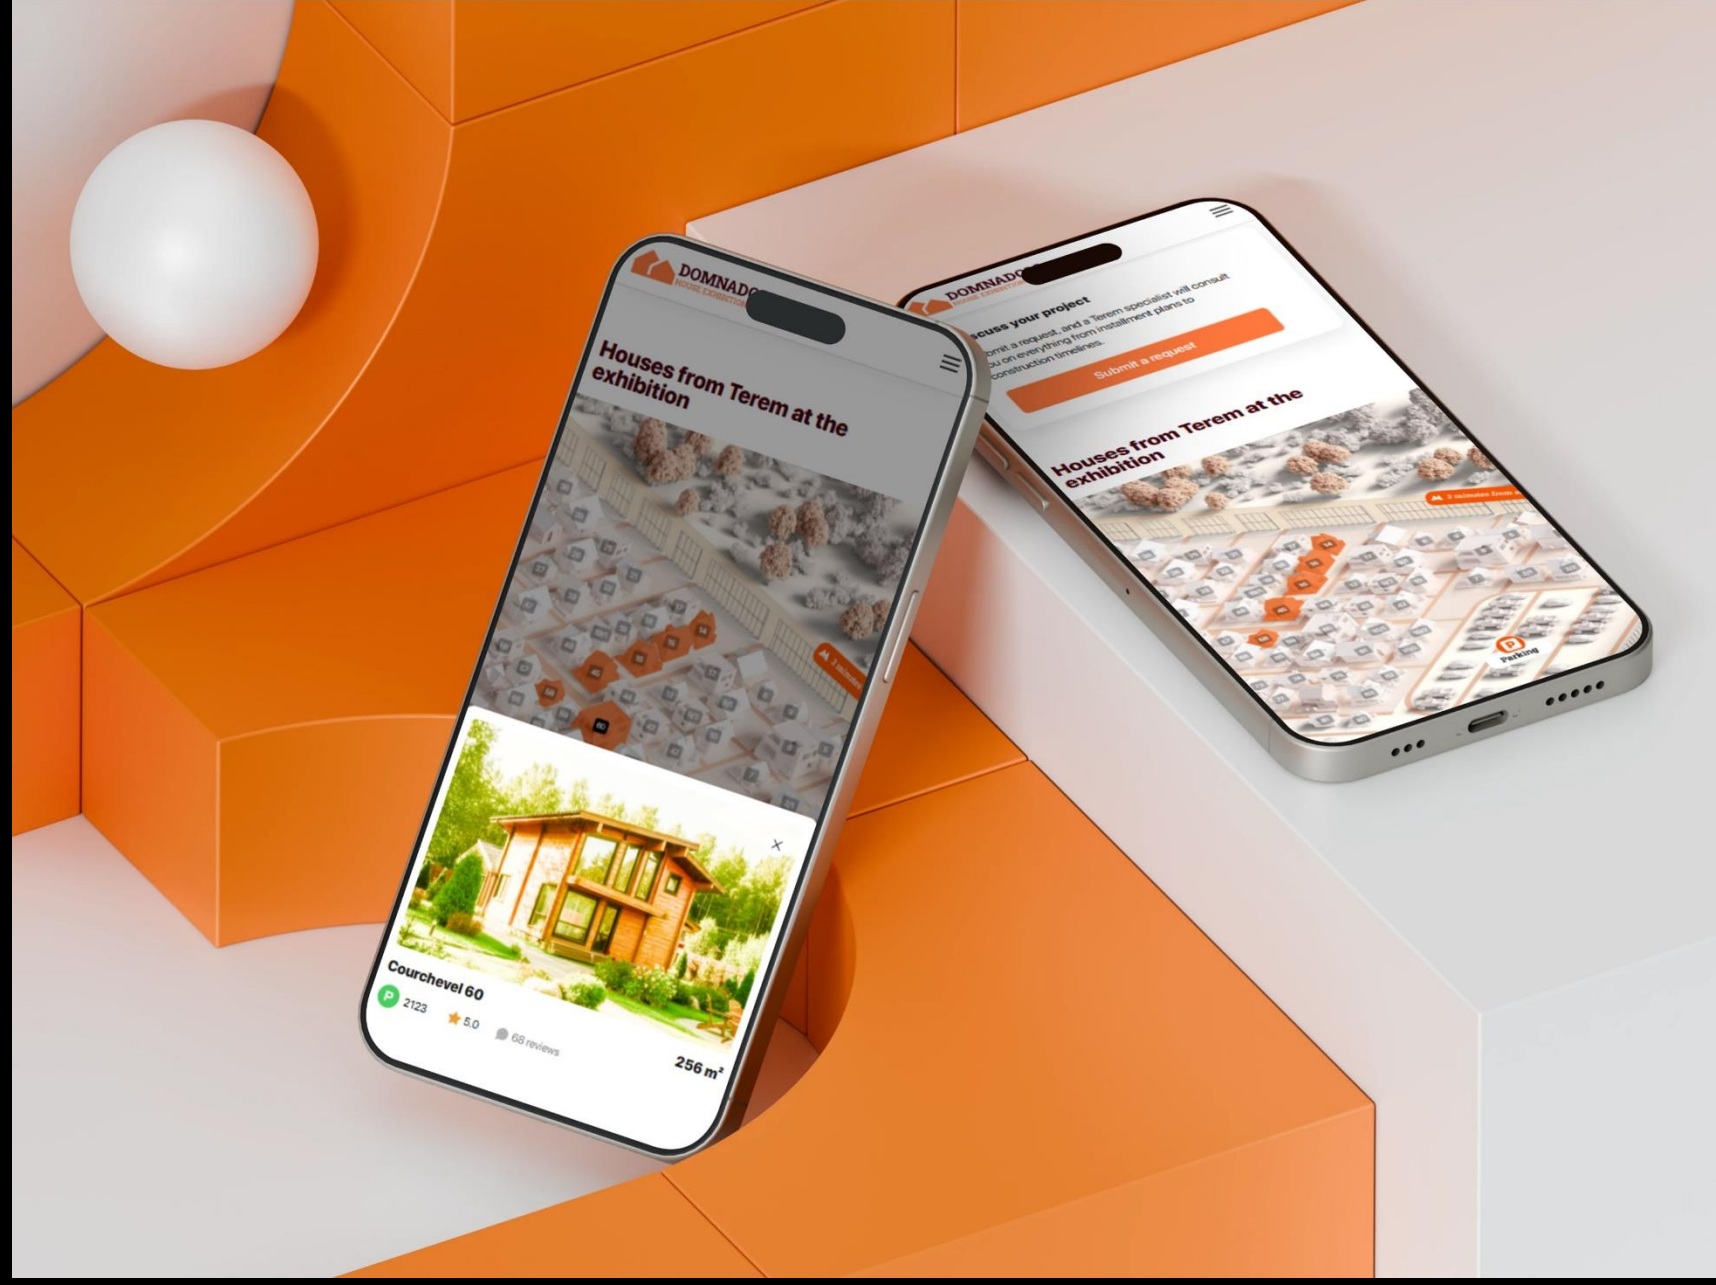
A company profile page that combines visual storytelling with lead generation. A hero slider showcases completed house projects, while a clean contact form invites potential clients to get in touch. Brief company description provides context and builds trust.



Mobile view: same slider + form + description, now in a clean vertical stack. Fully touch-friendly.



A full-screen interactive map built with SVG. Hover over any house — it lights up instantly. A simple but engaging way to explore project locations and get a feel for the neighborhood before even visiting.

The interactive map goes further — hover over any house and a popup appears with key details about the property. It's an intuitive way to explore the neighborhood without leaving the map view.


On mobile, the interaction adapts naturally: tap any house on the map, and a bottom sheet slides up with all the key property details. No hover, no clutter — just a clean, thumb-friendly popup designed for one-handed use.
